

I ♥ Booklets

This application...

...takes a PDF file with, for example, six pages,

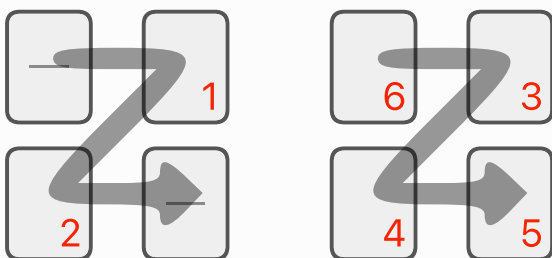

and creates a new PDF file with potentially more pages, the order of which is apparently scrambled.

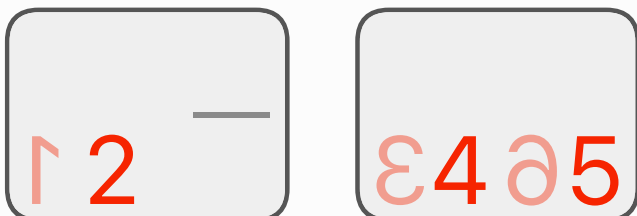

However, it does so in such a way that...

...if you print them, asking for two pages per sheet...

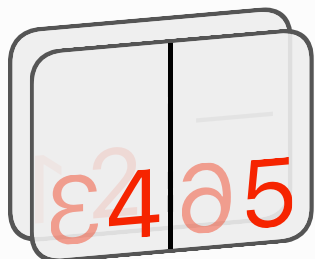

...recto verso (⚠ short edge)...

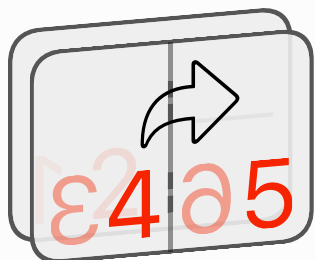

...then staple the entire set of sheets...

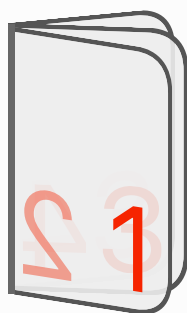

...marking a fold in the middle...

...and turn the left side over the right...

...now you have the booklet you've been waiting for!

The page size of the booklet is dictated by the printer, and is half the size of a standard sheet.

Please don't blame the app if this printing can't be done correctly!
